Recombinant heparanases are capable of removing the HS side chain from heparan sulfate proteoglycan (HSPG). Sulfated oligosaccharides, sulphonates or HSPG can be used to inhibit heparanase, this is useful for treatment of a physiological or medical condition associated with elevated heparanase activity, such as metastasis, angiogenesis, wound healing, angioplasty-induced restenosis, arteriosclerosis, atherosclerosis and inflammation. The human, murine and rat heparanases can be used to enhance wound healing, especially associated with tissue development and repair. The conditions mentioned above can be diagnosed using specific antibodies, and also using primers and probes specific for the heparanase polynucleotides. Other uses of the heparanases include sequencing sulfated molecules such as HSPG. The

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid sequences that encode heparanase enzymes having endoglucuronidase activity. Recombinant heparanases are capable of removing the Ms side chain from heparan sulfate proteoglycan (MSPG). Sulfated oligosaccharides, sulphonates or HSPG can be used to inhibit heparanase, this is useful for treatment of a physiological or medical condition associated with elevated heparanase activity, such as metastasis, angiogenesis, wound healing, angioplasty-induced restenosis, arteriosclerosis, atherosclerosis and inflammation. The human, murine and rat heparanases can be used to enhance wound healing, especially associated with tissue development and repair. The conditions mentioned above can be diagnosed using specific antibodies, and also using primers and probes specific for the heparanase polymucleotides. Other uses of the heparanases include sequencing sulfated molecules such as HSPG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Heparanase; endoglucuronidase; heparan sulfate proteoglycan; enzyme; metastasis; angiogenesis; wound healing; angioplasty-induced restenosis; arteriosclerosis; atherosclerosis; inflammation; tissue development; human; HSPG; ss.

Antagonists and inhibitors of the protein prevent CC it from degrading the extracellular matrix and releasing heparan sulfate CC from the extracellular matrix surface. The heparanase protein or the CC anti-heparanse antibody are used in pharmaceutical compositions for CC treating warm blooded animals suffering from a disease resulting from Shortage or lack of the heparanase protein, or from excessive activity CC or over-expression of the heparanase protein, respectively. The CC heparanase protein is used in treating diseases such as trauma, CC autoimmune disease, skin disease; cardiovascular diseases and nervous system diseases including Alzheimer's disease resulting from shortage or lack of polypeptide. The anti-heparanase antibody is used in treating CC the diseases like cancer, cancer metastasis, angiogenesis and cCC over expression of heparanase protein. The anti-heparanase antibody can be used to detect the presence or absence of polypeptide and its

This invention describes a novel heparanase inhibitor which can be used for the treatment or prevention of cardiac insufficiency and associated indications, symptoms and/or malfunctions. The heparanase inhibitor of the invention has cardiant, nephrotropic and hepatotropic activity. The products of the invention can be used in human and veterinary medicine, for the treatment or prevention of congestive heart failure e.g. primary cardiomyopathy. Associated conditions treated or prevented with the inhibitor are especially peripheral odemas, pulmonary and hepatic congestion, dyspnoea, hydrothorax and ascites. Renal problems, e.g. nocturia can also be treated. This sequence encodes the human heparanase protein described in the method of the invention.

The present invention describes an oligonucleotide having a sequence complementary to a sequence of the number of a heparanase. The oligonucleotide hybridises with the ribonucleic acid under condition of high stringency and has a sequence comprising 10-40 bp. The
                                                                                             New oligonucleotide having a sequence complementary to a sequence ribonucleic acid encoding a heparanase, useful for preparing a composition for treating tumor -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               internucleoside linkages of the oligonucleotide comprise at least one phosphorothicate linkage. Hybridisation of the oligonucleotide to the ribonucleic acid inhibit expression of the heparanase, where inhibition of heparanase means at least a 50% reduction in the quality of heparanase means at least a 50% reduction in the quality of heparanase. Also described: (1) a method of inhibiting expression of a heparanase in a cell; (2) a composition comprising the above oligonucleotide in an amount effective to inhibit the expression of heparanase in the cell and a carrier; and (3) a method of treating a tumour in a subject comprises administering to the subject an amount of the above oligonucleotide effective to inhibit expression of a heparanase in the subject. Heparanase antisense oligonucleotides have cytostatic activity, can be used in gene therapy, and can be used for preparing a composition for treating tumours. The present sequence encodes human heparanase, which is given in the exemplification of the present invertice.

                                                                                                              δ
                                                                                                                                           밁
                                                                                                                                                                     5
                                                                                                                                                                                                                                                                                 This sequence encodes the human pre-proheparanase of the invention. This conveners was isolated from human platelets. The heparanase can be used for identifying agents which alter heparanase activity. The heparanase can be used for wound healing or for blocking angiogenesis or inflammation. It can be used for treating e.g. psoriasis, diabetic retinopathy or solid tumours, or for the degradation of heparin and the neutralisation of heparanase activity can be used in the treatment of contribitors of heparanase activity can be used in the treatment of carbiritis, asthma, and other inflammatory diseases, vascular restenosis, catherosclerosis, tumour growth and progression, fibroproliferative catherosclerosis, tumour growth and progression, fibroproliferative consenses. The products can also be used for detection and diagnosis. The convenient selection of compounds having anti-heparanase and the paranase and the paranase activity. Inhibition of heparanase activity, allows for the convenient selection of compounds having anti-heparanase activity. Can be measured by blocking heparanase-mediated release of radioactive fragments from in covor radiolabelled (HSPG)/heparin.
                                                                                                                                                                                                    Query Match

The signal peptide of the nucleic acid can be used to express membrane-associated or secreted proteins in heterologous expression systems. The encoded polypeptides can be used to prevent tumour angiogenesis, metastasis and invasion, and to intervene with pathologies associated with impaired heparin-binding growth factors, cellular responses to heparin-binding growth factors and cytokines, cell interaction with plasma lipoproteins, cellular susceptibility to viral, protozoa and bacterial infections or disintegration of neurodegenerative plaques. /clone_Tib="Homo sapiens PLACENTA COT 25-NORMALIZED"
/clone_Tist strand cDNA was primed with a NotI-oligo(dT)
primer. Five prime end enriched, double-strand cDNA was
digested with Not I and cloned into the Not I and EcoR v
sites of the pCMVSPORT 6 vector. Library was normalized.

First strandd cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an ECGR I adaptor, digested with Not I, and cloned directionally into pf773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AGAATCCGGC. The cell line was provided by Dr
